How to design a wind turbine?

The design process begins with the construction of morphology chart until the drawing and animated simulation using CATIA software. The design was also proven by the fabrication using 3D printing machine Zortrax M200 and conventional lathe machine. Finally the wind turbine was assembled according to the design target.

How does a wind turbine work?

Conclusion: A wind turbine only operates when the wind is blowing, and understanding how a wind turbine works means understanding the aerodynamics of the wind and blades, while also knowing how a turbine generator creates electricity. At its most fundamental roots, a wind turbine works by allowing wind to rotate a turbine generator.

How does a turbine generator work?

The gearbox works like the gears on a bicycle, as the gears change, the rotational speeds will change too. Then, it transfers the rotational energy into the high-speed turbine shaft and into the generator. (7) The high-speed turbine shaft connects the gear box and the generator. Its high rotating speeds are what spin the turbine generator.
